

3 cut-vertex / find Articulation point:

Articulation point: Removal of the vertex & associated edges will disconnect the graph.

9

Here ② is articulation point.

∴ If you remove ②

→

Condition

Consider (u, v)
 ↓ ↓
parent child

If $L[v] \geq 2L[u] \Rightarrow u$ is articulation point

↓
This condition holds good for all nodes, except root node.

Tracing

Apply DFS

| vertex | 0 | 1 | 2 | 3 | 4 | 5 |
|--------|---|---|---|---|---|---|
| d | 0 | 5 | 2 | 1 | 3 | 4 |
| L | 0 | 0 | 0 | 0 | 2 | 2 |

$d \rightarrow$ discovery time. i.e; the order in which you visit the node in DFS

$L \rightarrow$ parent node through back edge.

Note:- If you start $d=0$, then you can take $L = \text{parent node directly}$.
If you start as $d=1$, then you should take $L = (\text{parent node} + 1)$

edge (u, v)

Formula

$$L[v] \geq d[u]$$

$(3, 2)$

$$L[2] \geq d[3]$$

$$[0 \geq 1]$$

$\Rightarrow \text{False} \Rightarrow 3 \text{ is not AP}$

$(2, 4)$

$$L[4] \geq d[2]$$

$$[2 \geq 2]$$

$\Rightarrow \text{True} \Rightarrow 2 \text{ is AP}$

Time complexity:

Since finding AP involves finding DFS also. Its complexity is same as that of DFS.

$$O(n)$$

where $n \rightarrow$ no of vertices

We can also say,

we scan the array $[L, R]$, once. It has n elements

∴ Time complexity = $O(n)$

Program Tracing:

adjacency list:

| | 0 | 1 | 2 | 3 | 4 | 5 |
|---|---|---|---|---|---|---|
| 0 | 0 | 1 | 0 | 1 | 0 | 0 |
| 1 | 1 | 0 | 1 | 0 | 0 | 0 |
| 2 | 0 | 1 | 0 | 1 | 1 | 1 |
| 3 | 1 | 0 | 1 | 0 | 0 | 0 |
| 4 | 0 | 0 | 1 | 0 | 0 | 1 |
| 5 | 0 | 0 | 1 | 0 | 1 | 0 |

output

Articulation point : 2
